

$$Q(s_t, a_t) \leftarrow Q(s_t, a_t) + \alpha [r_{t+1} + \lambda \max_a Q(s_{t+1}, a) - Q(s_t, a_t)]$$

(The New Action Value = The Old Value) + The Learning Rate \times (The New Information — the Old Information)

Deep learning

Michal CHOVANEC, PhD

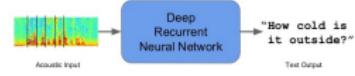

Applications

- self driving cars - Tesla model S
- healthcare, biomedical engineering - Cell in fluid
- voice search, control - Google, Amazon Echo
- machine translation - Google translator
- image recognition - Huawei Mate 10
- game bots, robotics - DeepMind, Boston Dynamics

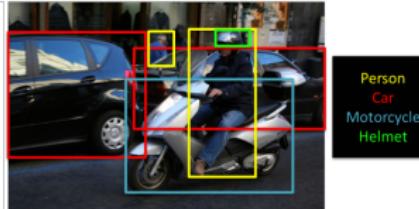

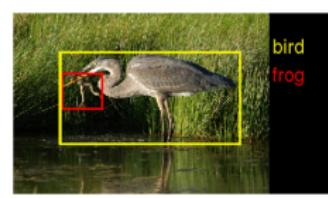

Speech Recognition

Reduced word errors by more than 30%

Neural network

Simple Neural Network

Deep Learning Neural Network

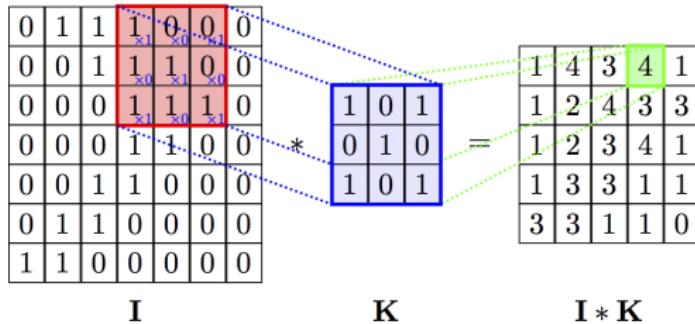

● Input Layer

● Hidden Layer

● Output Layer

Convolutional layer

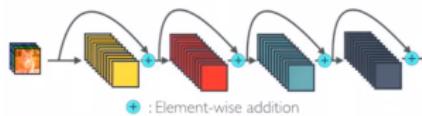

$$Y_{yxI} = \sum_k^{in_depth} \sum_j^{kh} \sum_i^{kw} X_{k,j+y,i+x} W_{lkji} + b_I$$

Deep neural network

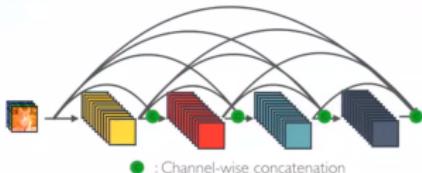

- Old methods (before NN) - 2011, 25.8%
- Convolutional, AlexNet - 2012, 16.4%
- Google inception - 2013, 6.7%
- Microsoft ResNet - 2015, 6.1%
- DenseNet - 2018, 5.17%
- CNN

- ResNET

- DenseNet

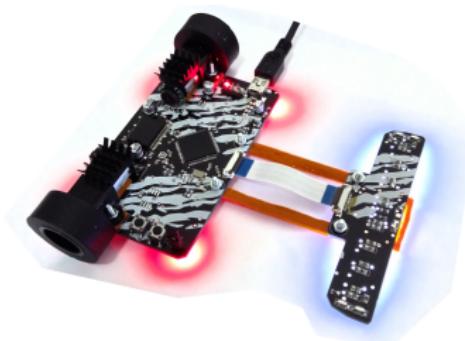

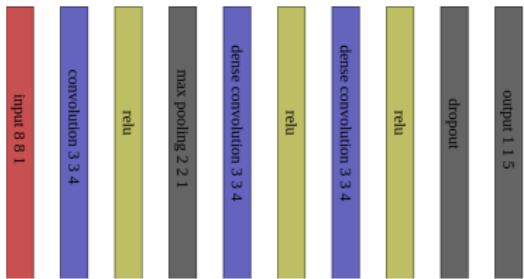

My research

- Robotics - hobby
- Red blood cells trajectory prediction
- Deep reinforcement learning

Robotics - line follower

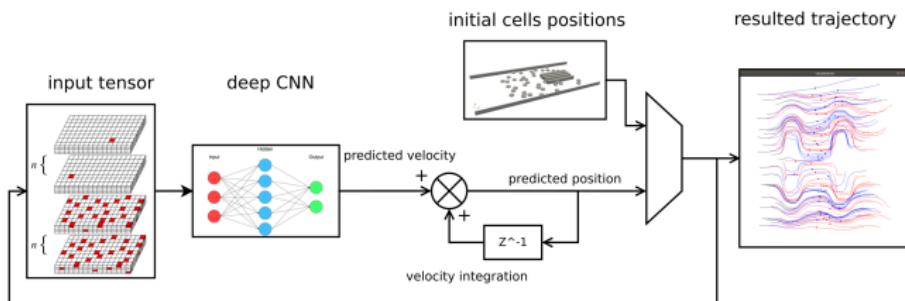

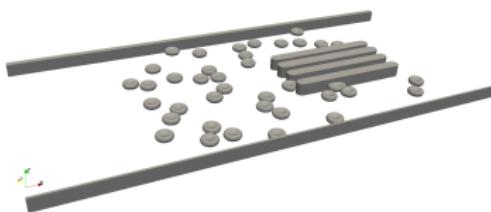

Curve shape classification

- stm32f303 (72MHz),
stm32f746 (216MHz)
- 8x 500nm line sensors
- pololu motors, 1:30
- network input : 8 last line
sensors results (8x8 matrix)
- response 4..5ms

Red blood cells trajectory prediction

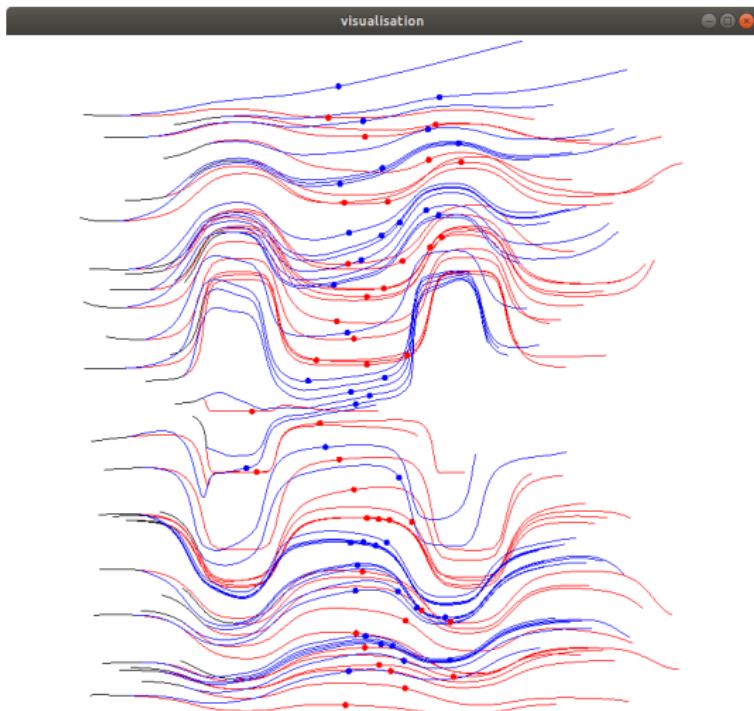

- train DNN to predict RBC trajectory from past
- 15 conv layers network (6hours training on GTX1080ti)
- input : RBC position + 7 past frames + other cells position
- output: RBC predicted velocity

Reinforcement learning

- learn from punishment and rewards
- learn to play a game with unknown rules
- obtain **state**, s
- choose **action**, a
- **execute** action
- obtain **reward**, R
- learn from **experiences**, $Q(s, a) = R + \gamma \max_{\alpha'} Q(s', \alpha')$

$$Q(s, a) \approx \hat{Q}(s, a; w)$$

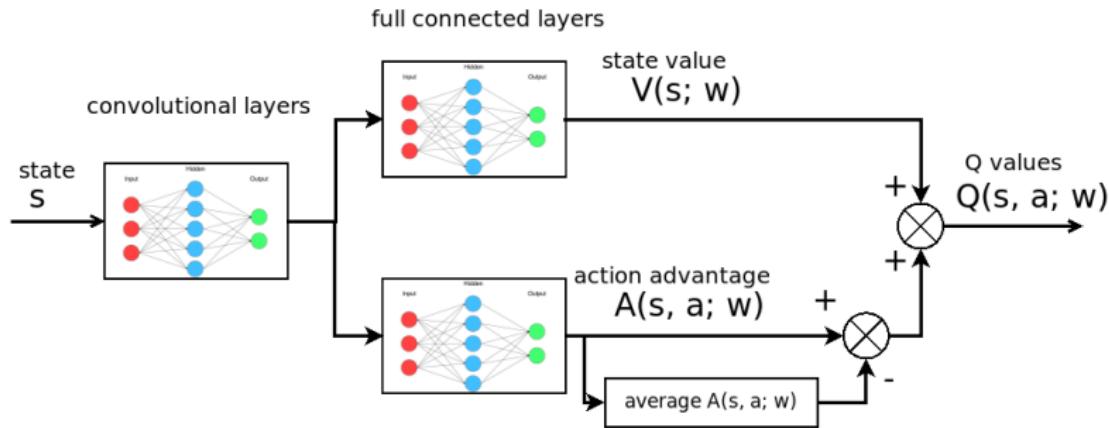

Dueling deep Q network - DDQN (2016)

$$\hat{Q}(s, a; w) = \hat{V}(s; w) + \hat{A}(s, a; w)$$

value for being in state s advantage of taking action a at state s

to avoid identifiability we subtract average value of A truth all actions

$$\hat{Q}(s, a; w) = \hat{V}(s; w) + \hat{A}(s, a; w) - \frac{1}{N_{\alpha'}} \sum_{\alpha'} \hat{A}(s, \alpha'; w)$$

Dueling deep Q network - DDQN

using DQN equation

$$\hat{Q}(s, a; w) = R + \gamma \max_{\alpha'} \hat{Q}(s', \alpha'; w')$$

we obtain dueling deep Q network equation

$$\hat{Q}(s, a; w) = R + \gamma \left(\hat{V}(s'; w') + \max_{\alpha'} \hat{A}(s', \alpha'; w') - \frac{1}{N_{\alpha'}} \sum_{\alpha'} \hat{A}(s', \alpha'; w') \right)$$

and finally the weights update rule

$$\Delta w = \eta \left(R + \gamma \left(\hat{V}(s'; w') + \max_{\alpha'} \hat{A}(s', \alpha'; w') - \frac{1}{N_{\alpha'}} \sum_{\alpha'} \hat{A}(s', \alpha'; w') \right) - \hat{Q}(s, a; w) \right) \nabla_w \hat{Q}(s, a; w)$$

Playing GO (October 2017)

- **supervised training** - train game using Masters games
- **reinforcement learning** - let play two networks against each other

Network architecture

we need to go much deeper for GO

- **27 convolutional layers**

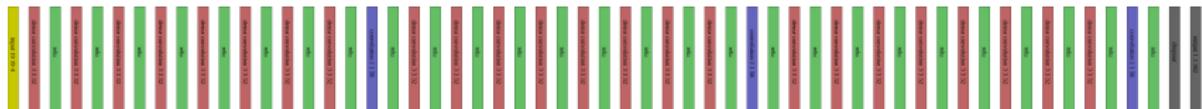

3 blocks with 8 dense conv + 1 conv layer

- **input**

4 matrices 19×19 : black stones, white stones, empty fields, active player

- **output**

recommended moves $19 \times 19 + 1$ for pass = 362 outputs
